DETAILED ACTION

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 22-38 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claim 5 of U.S. Patent No. 6,323,735. Although the conflicting claims are not identical, they are not patentably distinct from each other.

Regarding claim 22-24, claim 5 of U.S. Patent No. 6,323,735 recites a method of assembling a semiconductor package comprising: forming inductors or inductance circuits (first and second inductors) at least partially between the integrated circuit and the package substrate. Each inductor is formed by coupling first and second conductive features between the integrated circuit and at least one substrate electrical contact (as called for in claims 5, 7 of USP 6,323,735).

Regarding claims 25 and 26, claim of USP 6,323,735 recites a method of forming first and second inductors wherein the inductance value of the first and second inductors depends on the identity of the alternative substrate electrical contacts.

Art Unit: 2816

Regarding claims 27 and 28, claim 8 of USP 6,323,735 recites the substrate electrical contacts comprise substrate bonding pads disposed a variable distances from the integrated circuit (claim 8).

Regarding claims 29 and 30, claim 9 of USP 6,323,735 recites a first set of alternative substrate electrical contacts corresponding to the first inductor comprising bonding pads and conductive features comprising solder bumps.

Regarding claim 32, claim 9 of USP 6,323,735 recites a method for forming a plurality of inductances comprising of forming bonding pads positioned at variable locations and coupling them to a plurality of conductive features.

Regarding claim 33-38, claims 23-26 of USP 6,323,735 recite a phase locked-loop circuit comprising a controlled oscillator within the integrated circuit. The controlled oscillator comprises a LC tank. The output of the frequency synthesizer inherently covers a plurality of frequency bands and the capacitor is electrically coupled to the inductors and the inductors are formed within the semiconductor package.

Allowable Subject Matter

Claim 39 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claim 39 is objected to because USP 6,323,735 fails to teach or fairly suggest a method of forming inductors wherein the first and second inductor are formed symmetrically with respect to each other.
